# Boolean Algebra and Logic Gates 

## COE 202

Digital Logic Design
Dr. Muhamed Mudawar
King Fahd University of Petroleum and Minerals

## Presentation Outline

* Boolean Algebra
* Boolean Functions and Truth Tables
* DeMorgan's Theorem
* Algebraic manipulation and expression simplification
* Logic gates and logic diagrams
* Minterms and Maxterms
* Sum-Of-Products and Product-Of-Sums

## Boolean Algebra

* Introduced by George Boole in 1854
$\Varangle$ Two-valued Boolean algebra is also called switching algebra
* A set of two values: $B=\{0,1\}$
* Three basic operations: AND, OR, and NOT
* The AND operator is denoted by a dot ( $\cdot$ )
$\diamond x \cdot y$ or $x y$ is read: $x$ AND $y$
$*$ The OR operator is denoted by a plus (+)
$\diamond x+y$ is read: $x \mathbf{O R} y$
* The NOT operator is denoted by (') or an overbar ( ${ }^{-}$).
$\diamond x^{\prime}$ or $\bar{x}$ is the complement of $x$

## Postulates of Boolean Algebra

1. Closure: the result of any Boolean operation is in $B=\{0,1\}$
2. Identity element with respect to + is $0: x+0=0+x=x$ Identity element with respect to $\cdot$ is $1: x \cdot 1=1 \cdot x=x$
3. Commutative with respect to $+: x+y=y+x$

Commutative with respect to $\cdot: x \cdot y=y \cdot x$
4. $\cdot$ is distributive over $+: x \cdot(y+z)=(x \cdot y)+(x \cdot z)$

+ is distributive over $\cdot: x+(y \cdot z)=(x+y) \cdot(x+z)$

5. For every $x$ in B , there exists $x^{\prime}$ in B (called complement of $x$ ) such that: $x+x^{\prime}=1$ and $x \cdot x^{\prime}=0$

## AND, OR, and NOT Operators

* The following tables define $x \cdot y, x+y$, and $x^{\prime}$
* $x \cdot y$ is the AND operator
* $x+y$ is the OR operator
* $x^{\prime}$ is the NOT operator

| $\mathbf{x} \mathbf{y}$ | $\mathbf{x} \cdot \mathbf{y}$ | $\mathbf{x}$ | $\mathbf{y}$ | $\mathbf{x + y}$ | $\mathbf{x}$ | $x^{\prime}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0 | 1 | 0 | 0 | 1 | 1 | 1 |
| 1 | 0 | 0 | 1 | 0 | 1 | 0 |
| 1 | 1 | 1 | 1 | 1 | 1 |  |

## Boolean Functions

* Boolean functions are described by expressions that consist of:
$\diamond$ Boolean variables, such as: $x, y$, etc.
$\triangleleft$ Boolean constants: 0 and 1
» Boolean operators: AND (•), OR (+), NOT (')
$\diamond$ Parentheses, which can be nested
* Example: $f=x\left(y+w^{\prime} z\right)$
$\checkmark$ The dot operator is implicit and need not be written
* Operator precedence: to avoid ambiguity in expressions
$\diamond$ Expressions within parentheses should be evaluated first
$\diamond$ The NOT (') operator should be evaluated second
$\diamond$ The AND (•) operator should be evaluated third
$\diamond$ The OR (+) operator should be evaluated last

## Truth Table

* A truth table can represent a Boolean function
* List all possible combinations of 0's and 1's assigned to variables
* If $n$ variables then $2^{n}$ rows
* Example: Truth table for $f=x y^{\prime}+x^{\prime} z$

| $\mathbf{x}$ | $\mathbf{y}$ | $\mathbf{z}$ | $\mathbf{y}^{\prime}$ | $\mathbf{x} \mathbf{y}^{\prime}$ | $\mathbf{x}^{\prime}$ | $\mathbf{x}^{\prime} \mathbf{z}$ | $\mathbf{f}=\mathbf{x y} \mathbf{'}^{\prime}+\mathbf{x}^{\prime} \mathbf{z}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 1 | 0 | 1 | 0 | 0 |
| 0 | 0 | 1 | 1 | 0 | 1 | 1 | 1 |
| 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 |
| 0 | 1 | 1 | 0 | 0 | 1 | 1 | 1 |
| 1 | 0 | 0 | 1 | 1 | 0 | 0 | 1 |
| 1 | 0 | 1 | 1 | 1 | 0 | 0 | 1 |
| 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |

## DeMorgan's Theorem

$*(x+y)^{\prime}=x^{\prime} y^{\prime}$

* $(x y)^{\prime}=x^{\prime}+y^{\prime}$

| X | y | $\mathrm{x}^{\prime}$ | $y^{\prime}$ | $x+y$ | $(x+y)^{\prime}$ | $x^{\prime} y^{\prime}$ | $x$ y | $\left.{ }^{(x y}\right)^{\prime}$ | $x^{\prime}+y^{\prime}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | 1 | 0 | 1 | 1 | 0 | 1 | 1 |
| 0 | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 1 | 1 |
| 1 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 1 | 1 |
| 1 | 1 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 |

* Generalized DeMorgan's Theorem:
$\nLeftarrow\left(x_{1}+x_{2}+\cdots+x_{n}\right)^{\prime}=x_{1}^{\prime} \cdot x_{2}^{\prime} \cdot \cdots \cdot x_{n}^{\prime}$
$\not\left(x_{1} \cdot x_{2} \cdot \cdots \cdot x_{n}\right)^{\prime}=x_{1}^{\prime}+x_{2}^{\prime}+\cdots+x_{n}^{\prime}$

## Complementing Boolean Functions

* What is the complement of $f=x^{\prime} y z^{\prime}+x y^{\prime} z^{\prime}$ ?
* Use DeMorgan's Theorem:
$\triangleleft$ Complement each variable and constant
« Interchange AND and OR operators
* So, what is the complement of $f=x^{\prime} y z^{\prime}+x y^{\prime} z^{\prime}$ ?

Answer: $f^{\prime}=\left(x+y^{\prime}+z\right)\left(x^{\prime}+y+z\right)$

* Example 2: Complement $g=\left(a^{\prime}+b c\right) d^{\prime}+e$
* Answer: $g^{\prime}=\left(a\left(b^{\prime}+c^{\prime}\right)+d\right) e^{\prime}$

## Algebraic Manipulation of Expressions

* The objective is to acquire skills in manipulating Boolean expressions, to transform them into simpler form.
*. Example 1: prove $x+x y=x$
(absorption theorem)
*Proof: $x+x y=x \cdot 1+x y$

$$
x \cdot 1=x
$$

$$
\begin{aligned}
& =x \cdot(1+y) \\
& =x \cdot 1=x
\end{aligned}
$$

Distributive - over +
$(1+y)=1$

* Example 2: prove $x+x^{\prime} y=x+y$ (simplification theorem)
*Proof: $x+x^{\prime} y=\left(x+x^{\prime}\right)(x+y) \quad$ D

$$
\begin{aligned}
& =1 \cdot(x+y) \\
& =x+y
\end{aligned}
$$

## Consensus Theorem

Prove that: $x y+x^{\prime} z+y z=x y+x^{\prime} z$ (consensus theorem)
Proof: $x y+x^{\prime} z+y z$

$$
\begin{aligned}
& =x y+x^{\prime} z+1 \cdot y z \\
& =x y+x^{\prime} z+\left(x+x^{\prime}\right) y z \\
& =x y+x^{\prime} z+x y z+x^{\prime} y z \\
& =x y+x y z+x^{\prime} z+x^{\prime} y z \\
& =x y \cdot 1+x y z+x^{\prime} z \cdot 1+x^{\prime} z y \\
& =x y(1+z)+x^{\prime} z(1+y) \\
& =x y \cdot 1+x^{\prime} z \cdot 1 \\
& =x y+x^{\prime} z
\end{aligned}
$$

$$
y z=1 \cdot y z
$$

$$
1=\left(x+x^{\prime}\right)
$$

Distributive • over +
Associative commutative +

$$
x y=x y \cdot 1, \quad x^{\prime} y z=x^{\prime} z y
$$

Distributive • over +

Distributive • over +

$$
\begin{aligned}
& 1+z=1, \quad 1+y=1 \\
& x y \cdot 1=x y, \quad x^{\prime} z \cdot 1=x^{\prime} z
\end{aligned}
$$

## Summary of Boolean Algebra

## Property

Identity
Complement

$$
x+x^{\prime}=1
$$

Null
Idempotence

$$
x+0=x
$$

$$
x+1=1
$$

$$
x+x=x
$$

Involution

$$
\left(x^{\prime}\right)^{\prime}=x
$$

Commutative
Associative
Distributive

$$
x(y+z)=x y+x z
$$

Absorption

$$
x+x y=x
$$

Simplification

$$
x+x^{\prime} y=x+y
$$

De Morgan

$$
(x+y)^{\prime}=x^{\prime} y^{\prime}
$$

$$
\begin{array}{rlrl}
x+y & =y+x & x y & =y x \\
(x+y)+z & =x+(y+z) & (x y) z & =x(y z)
\end{array}
$$

Dual Property

$$
\begin{aligned}
& x \cdot 1=x \\
& x \cdot x^{\prime}=0 \\
& x \cdot 0=0 \\
& x \cdot x=x
\end{aligned}
$$

$$
x+y z=(x+y)(x+z)
$$

$$
x(x+y)=x
$$

$$
x\left(x^{\prime}+y\right)=x y
$$

$$
(x y)^{\prime}=x^{\prime}+y^{\prime}
$$

## Duality Principle

$\not \approx$ The dual of a Boolean expression can be obtained by:
$\diamond$ Interchanging AND (•) and OR (+) operators
$\diamond$ Interchanging 0's and 1's

* Example: the dual of $x\left(y+z^{\prime}\right)$ is $x+y z^{\prime}$
$\triangleleft$ The complement operator does not change
* The properties of Boolean algebra appear in dual pairs
$\triangleleft$ If a property is proven to be true then its dual is also true

Identity
Complement
Distributive

## Property

$$
\begin{gathered}
x+0=x \\
x+x^{\prime}=1 \\
x(y+z)=x y+x z
\end{gathered}
$$

## Expression Simplification

* Using Boolean algebra to simplify expressions
* Expression should contain the smallest number of literals
* A literal is a variable that may or may not be complemented

Example: simplify $a b+a^{\prime} c d+a^{\prime} b d+a^{\prime} c d^{\prime}+a b c d$

* Solution: $a b+a^{\prime} c d+a^{\prime} b d+a^{\prime} c d^{\prime}+a b c d \quad$ (15 literals)

$$
\begin{aligned}
& =a b+a b c d+a^{\prime} c d+a^{\prime} c d^{\prime}+a^{\prime} b d \\
& =a b+a b(c d)+a^{\prime} c\left(d+d^{\prime}\right)+a^{\prime} b d \\
& =a b+a^{\prime} c+a^{\prime} b d \\
& =b a+b a^{\prime} d+a^{\prime} c \\
& =b\left(a+a^{\prime} d\right)+a^{\prime} c \\
& =b(a+d)+a^{\prime} c
\end{aligned}
$$

(15 literals)
(13 literals)
(7 literals)
(7 literals)
(6 literals)
(5 literals only)

## Importance of Boolean Algebra

* Our objective is to learn how to design digital circuits
* These circuits use signals with two possible values
* Logic 0 is a low voltage signal (around 0 volts)
* Logic 1 is a high voltage signal (e.g. 5 or 3.3 volts)
* The physical value of a signal is the actual voltage it carries, while its logic value is either 0 (low) or 1 (high)
* Having only two logic values (0 and 1) simplifies the implementation of the digital circuit

## Next . . .

* Boolean Algebra
* Boolean Functions and Truth Tables
* DeMorgan's Theorem
* Algebraic manipulation and expression simplification
* Logic gates and logic diagrams
* Minterms and Maxterms
* Sum-Of-Products and Product-Of-Sums

## Logic Gates and Symbols

AND: Switches in series logic 0 is open switch

OR gate

OR: Switches in parallel logic 0 is open switch

NOT gate (inverter)

NOT: Switch is normally closed when x is 0

* In the earliest computers, relays were used as mechanical switches controlled by electricity (coils)
* Today, tiny transistors are used as electronic switches that implement the logic gates (CMOS technology)

## Truth Table and Logic Diagram

* Given the following logic function: $f=x\left(y^{\prime}+z\right)$
* Draw the corresponding truth table and logic diagram

## Truth Table

| $x$ | $y$ | $z$ | $y^{\prime}+z$ | $f=x\left(y^{\prime}+z\right)$ |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 1 | 0 |
| 0 | 0 | 1 | 1 | 0 |
| 0 | 1 | 0 | 0 | 0 |
| 0 | 1 | 1 | 1 | 0 |
| 1 | 0 | 0 | 1 | 1 |
| 1 | 0 | 1 | 1 | 1 |
| 1 | 1 | 0 | 0 | 0 |
| 1 | 1 | 1 | 1 | 1 |

Logic Diagram

Truth Table and Logic Diagram describe the same function $f$. Truth table is unique, but logic expression and logic diagram are not. This gives flexibility in implementing logic functions.

## Combinational Circuit

* A combinational circuit is a block of logic gates having:
$n$ inputs: $x_{1}, x_{2}, \ldots, x_{n}$ $m$ outputs: $f_{1}, f_{2}, \ldots, f_{m}$
$*$ Each output is a function of the input variables
* Each output is determined from present combination of inputs
* Combination circuit performs operation specified by logic gates

## Example of a Simple Combinational Circuit

* The above circuit has:
$\diamond$ Three inputs: $x, y$, and $z$
$\diamond$ Two outputs: $f$ and $g$
* What are the logic expressions of $f$ and $g$ ?
* Answer: $\quad f=x y+z^{\prime}$

$$
g=x y+y z
$$

## From Truth Tables to Gate Implementation

* Given the truth table of a Boolean function $f$, how do we implement the truth table using logic gates?

## Truth Table

| $\mathbf{x}$ | $\mathbf{y}$ | $\mathbf{z}$ | $\mathbf{f}$ |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 |  | 0 |
| 0 | 0 | 1 |  | 0 |
| 0 | 1 | 0 |  | 1 |
| 0 | 1 | 1 |  | 1 |
| 1 | 0 | 0 | 0 |  |
| 1 | 0 | 1 |  | 1 |
| 1 | 1 | 0 |  | 0 |
| 1 | 1 | 1 |  | 1 |

What is the logic expression of $f$ ?

What is the gate implementation of $f$ ?

To answer these questions, we need to define Minterms and Maxterms

## Minterms and Maxterms

* Minterms are AND terms with every variable present in either true or complement form
* Maxterms are OR terms with every variable present in either true or complement form

Minterms and Maxterms for 2 variables $x$ and $y$

| $\mathbf{x}$ | $\mathbf{y}$ | index | Minterm | Maxterm |
| :--- | :--- | :---: | :--- | :--- |
| 0 | 0 | 0 | $m_{0}=x^{\prime} y^{\prime}$ | $M_{0}=x+y$ |
| 0 | 1 | 1 | $m_{1}=x^{\prime} y$ | $M_{1}=x+y^{\prime}$ |
| 1 | 0 | 2 | $m_{2}=x y^{\prime}$ | $M_{2}=x^{\prime}+y$ |
| 1 | 1 | 3 | $m_{3}=x y$ | $M_{3}=x^{\prime}+y^{\prime}$ |

* For $n$ variables, there are $2^{n}$ Minterms and Maxterms

## Minterms and Maxterms for 3 Variables

| $\mathbf{x}$ | $\mathbf{y}$ | $\mathbf{z}$ | index | Minterm | Maxterm |
| :---: | :---: | :---: | :---: | :--- | :--- |
| 0 | 0 | 0 | 0 | $m_{0}=x^{\prime} y^{\prime} z^{\prime}$ | $M_{0}=x+y+z$ |
| 0 | 0 | 1 | 1 | $m_{1}=x^{\prime} y^{\prime} z$ | $M_{1}=x+y+z^{\prime}$ |
| 0 | 1 | 0 | 2 | $m_{2}=x^{\prime} y z^{\prime}$ | $M_{2}=x+y^{\prime}+z$ |
| 0 | 1 | 1 | 3 | $m_{3}=x^{\prime} y z$ | $M_{3}=x+y^{\prime}+z^{\prime}$ |
| 1 | 0 | 0 | 4 | $m_{4}=x y^{\prime} z^{\prime}$ | $M_{4}=x^{\prime}+y+z$ |
| 1 | 0 | 1 | 5 | $m_{5}=x y^{\prime} z$ | $M_{5}=x^{\prime}+y+z^{\prime}$ |
| 1 | 1 | 0 | 6 | $m_{6}=x y z^{\prime}$ | $M_{6}=x^{\prime}+y^{\prime}+z$ |
| 1 | 1 | 1 | 7 | $m_{7}=x y z$ | $M_{7}=x^{\prime}+y^{\prime}+z^{\prime}$ |

Maxterm $M_{i}$ is the complement of Minterm $m_{i}$

$$
M_{i}=m_{i}^{\prime} \text { and } m_{i}=M_{i}^{\prime}
$$

## Purpose of the Index

* Minterms and Maxterms are designated with an index
* The index for the Minterm or Maxterm, expressed as a binary number, is used to determine whether the variable is shown in the true or complemented form
* For Minterms:
s '1' means the variable is Not Complemented
$\triangleleft$ ' 0 ' means the variable is Complemented
$\star$ For Maxterms:
$\checkmark$ ' 0 ' means the variable is Not Complemented
$\diamond$ ' 1 ' means the variable is Complemented

## Sum-Of-Minterms (SOM) Canonical Form

## Truth Table

| $\mathbf{x}$ | $\mathbf{y}$ | $\mathbf{z}$ | $\mathbf{f}$ | Minterm |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 0 |  |
| 0 | 0 | 1 | 0 |  |
| 0 | 1 | 0 | 1 | $m_{2}=x^{\prime} y z^{\prime}$ |
| 0 | 1 | 1 | 1 | $m_{3}=x^{\prime} y z$ |
| 1 | 0 | 0 | 0 |  |
| 1 | 0 | 1 | 1 | $m_{5}=x y^{\prime} z$ |
| 1 | 1 | 0 | 0 |  |
| 1 | 1 | 1 | 1 | $m_{7}=x y z$ |

## Sum of Minterm entries

 that evaluate to ' 1 'Focus on the ' 1 ' entries

$$
f=m_{2}+m_{3}+m_{5}+m_{7}
$$

$$
f=\sum(2,3,5,7)
$$

$$
f=x^{\prime} y z^{\prime}+x^{\prime} y z+x y^{\prime} z+x y z
$$

## Examples of Sum-Of-Minterms

$f(a, b, c, d)=\sum(2,3,6,10,11)$
$f(a, b, c, d)=m_{2}+m_{3}+m_{6}+m_{10}+m_{11}$
\& $f(a, b, c, d)=a^{\prime} b^{\prime} c d^{\prime}+a^{\prime} b^{\prime} c d+a^{\prime} b c d^{\prime}+a b^{\prime} c d^{\prime}+a b^{\prime} c d$
$g(a, b, c, d)=\sum(0,1,12,15)$

* $g(a, b, c, d)=m_{0}+m_{1}+m_{12}+m_{15}$
$\nLeftarrow(a, b, c, d)=a^{\prime} b^{\prime} c^{\prime} d^{\prime}+a^{\prime} b^{\prime} c^{\prime} d+a b c^{\prime} d^{\prime}+a b c d$

## Product-Of-Maxterms (POM) Canonical Form

## Truth Table

| $\mathbf{x}$ | $\mathbf{y}$ | $\mathbf{z}$ | $\mathbf{f}$ | Maxterm |
| :--- | :--- | :--- | :--- | :---: |
| 0 | 0 | 0 | 0 | $M_{0}=x+y+z$ |
| 0 | 0 | 1 | 0 | $M_{1}=x+y+z^{\prime}$ |
| 0 | 1 | 0 | 1 |  |
| 0 | 1 | 1 | 1 |  |
| 1 | 0 | 0 | 0 | $M_{4}=x^{\prime}+y+z$ |
| 1 | 0 | 1 | 1 |  |
| 1 | 1 | 0 | 0 | $M_{6}=x^{\prime}+y^{\prime}+z$ |
| 1 | 1 | 1 | 1 |  |

## Product of Maxterm entries that evaluate to ' 0 '

## Focus on the ' 0 ' entries

$$
f=M_{0} \cdot M_{1} \cdot M_{4} \cdot M_{6}
$$

$$
f=\prod(0,1,4,6)
$$

$$
f=(x+y+z)\left(x+y+z^{\prime}\right)\left(x^{\prime}+y+z\right)\left(x^{\prime}+y^{\prime}+z\right)
$$

## Examples of Product-Of-Maxterms

* $f(a, b, c, d)=\Pi(1,3,11)$
* $f(a, b, c, d)=M_{1} \cdot M_{3} \cdot M_{11}$
$f(a, b, c, d)=\left(a+b+c+d^{\prime}\right)\left(a+b+c^{\prime}+d^{\prime}\right)\left(a^{\prime}+b+c^{\prime}+d^{\prime}\right)$
* $g(a, b, c, d)=\Pi(0,5,13)$
$g(a, b, c, d)=M_{0} \cdot M_{5} \cdot M_{13}$
$f(a, b, c, d)=(a+b+c+d)\left(a+b^{\prime}+c+d^{\prime}\right)\left(a^{\prime}+b^{\prime}+c+d^{\prime}\right)$

## Conversions between Canonical Forms

* The same Boolean function $f$ can be expressed in two ways:
« Sum-of-Minterms

$$
f=m_{0}+m_{2}+m_{3}+m_{5}+m_{7}=\sum(0,2,3,5,7)
$$

$\diamond$ Product-of-Maxterms $f=M_{1} \cdot M_{4} \cdot M_{6}=\Pi(1,4,6)$

## Truth Table

| $\mathbf{x}$ | $\mathbf{y}$ | $\mathbf{z}$ | $\mathbf{f}$ | Minterms | Maxterms |
| :--- | :--- | :--- | :--- | :--- | :---: |
| 0 | 0 | 0 | 1 | $m_{0}=x^{\prime} y^{\prime} z^{\prime}$ |  |
| 0 | 0 | 1 | 0 |  | $M_{1}=x+y+z^{\prime}$ |
| 0 | 1 | 0 | 1 | $m_{2}=x^{\prime} y z^{\prime}$ |  |
| 0 | 1 | 1 | 1 | $m_{3}=x^{\prime} y z$ |  |
| 1 | 0 | 0 | 0 |  | $M_{4}=x^{\prime}+y+z$ |
| 1 | 0 | 1 | 1 | $m_{5}=x y^{\prime} z$ |  |
| 1 | 1 | 0 | 0 |  | $M_{6}=x^{\prime}+y^{\prime}+z$ |
| 1 | 1 | 1 | 1 | $m_{7}=x y z$ |  |

> To convert from one canonical form to another, interchange the symbols $\sum$ and $\Pi$ and list those numbers missing from the original form.

## Function Complement

## Truth Table

| $x$ | $y$ | $z$ | $f$ | $f^{\prime}$ |
| :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | 1 | 0 |
| 0 | 0 | 1 | 0 | 1 |
| 0 | 1 | 0 | 1 | 0 |
| 0 | 1 | 1 | 1 | 0 |
| 1 | 0 | 0 | 0 | 1 |
| 1 | 0 | 1 | 1 | 0 |
| 1 | 1 | 0 | 0 | 1 |
| 1 | 1 | 1 | 1 | 0 |

Given a Boolean function $f$
$f(x, y, z)=\sum(0,2,3,5,7)=\prod(1,4,6)$
Then, the complement $f^{\prime}$ of function $f$

$$
f^{\prime}(x, y, z)=\prod(0,2,3,5,7)=\sum(1,4,6)
$$

The complement of a function expressed by a Sum of Minterms is the Product of Maxterms with the same indices. Interchange the symbols $\Sigma$ and $\Pi$, but keep the same list of indices.

## Summary of Minterms and Maxterms

* There are $2^{n}$ Minterms and Maxterms for Boolean functions with $n$ variables, indexed from 0 to $2^{n}-1$
* Minterms correspond to the 1-entries of the function
* Maxterms correspond to the 0-entries of the function
* Any Boolean function can be expressed as a Sum-of-Minterms and as a Product-of-Maxterms
* For a Boolean function, given the list of Minterm indices one can determine the list of Maxterms indices (and vice versa)
* The complement of a Sum-of-Minterms is a Product-of-Maxterms with the same indices (and vice versa)

## Sum-of-Products and Products-of-Sums

* Canonical forms contain a larger number of literals
$\diamond$ Because the Minterms (and Maxterms) must contain, by definition, all the variables either complemented or not
* Another way to express Boolean functions is in standard form
\& Two standard forms: Sum-of-Products and Product-of -Sums
* Sum of Products (SOP)
$\diamond$ Boolean expression is the ORing (sum) of AND terms (products)
$\diamond$ Examples: $f_{1}=x y^{\prime}+x z \quad f_{2}=y+x y^{\prime} z$
* Products of Sums (POS)
$\diamond$ Boolean expression is the ANDing (product) of OR terms (sums)
$\diamond$ Examples: $f_{3}=(x+z)\left(x^{\prime}+y^{\prime}\right) \quad f_{4}=x\left(x^{\prime}+y^{\prime}+z\right)$

## Two-Level Gate Implementation

$$
f_{1}=x y^{\prime}+x z
$$

$f_{3}=(x+z)\left(x^{\prime}+y^{\prime}\right)$

$f_{4}=x\left(x^{\prime}+y^{\prime}+z\right)$

## Two-Level vs. Three-Level Implementation

* $h=a b+c d+c e$ (6 literals) is a sum-of-products
* $h$ may also be written as: $h=a b+c(d+e)$ (5 literals)
* However, $h=a b+c(d+e)$ is a non-standard form
$\diamond h=a b+c(d+e)$ is not a sum-of-products nor a product-of-sums

2-level implementation

$$
h=a b+c d+c e
$$

3-level implementation

$$
h=a b+c(d+e)
$$
